

Tea Bunch — Complete Business Flow

1

Read left to right. Each numbered stage is expanded on the following pages.

Key routing rule

After payment, the fulfillment engine tries the nearest franchise first, then checks stock, central warehouse stock, other franchise stock, and finally backorder/cancel options.

Key exception paths

Payment failed → retry. Delivery failed → support/reassign. No stock → backorder if allowed, otherwise cancel/refund.

Closed-loop management

Every completed order produces settlement and reporting data. Management uses the results to reward/expand or train/audit.

Stage 01 — Super Admin / Head Office

2

Head Office creates and controls the operating network.

What Head Office controls

Company structure, franchises, products, warehouse stock, e-commerce availability, finance and reporting.

Why this stage matters

The network must be configured before a franchise can receive orders or a product can be sold.

Output

A working business network with franchises, products, stock and commercial controls ready for operation.

Stage 02 — Franchise Onboarding

3

Create the franchise completely before making it live.

Stage 03 — Product Management & Inventory

4

Create the product once, control where it can sell, then position stock.

A. Product creation and publishing

B. Inventory

Stage 04 — Customer E-Commerce Journey & Payment

5

The customer order becomes confirmed only after successful payment.

Location matters

The delivery location is used later to find the nearest practical fulfillment source.

Payment rule

Only a successful payment moves the order into the confirmed state.

Next stage

Confirmed orders enter the Fulfillment Engine for routing.

Stage 05 — Fulfillment Engine

6

The key decision flow: choose the best source for the customer's order.

Stage 06 — Pick, Pack, Delivery & Tracking

7

The selected fulfillment source prepares the order and chooses how it reaches the customer.

Acceptance failure

If the first franchise does not accept, admin can reassign the order.

Delivery failure

A delivery issue goes to support and can be reassigned.

Completion

Successful delivery leads to Order Completed and then settlement.

Stage 07 & 08 — Settlement, Reporting & Continuous Improvement

8

Close the financial loop, measure performance and improve the franchise network.

Settlement principle

Settlement depends on who fulfilled the order, so revenue and costs go to the correct party.

Reporting principle

Operational data becomes management information for sales, stock, e-commerce, delivery and settlement.

Management principle

Good performance supports reward/expansion. Poor performance triggers training/audit. Then operations continue.

Stakeholder View — Who Does What?

9

Use this page when explaining the system to a non-technical person.

Simple explanation

Head Office creates and controls the business. Customers create demand. The fulfillment engine decides where the order should be processed. A franchise, central warehouse or another franchise fulfills it. Delivery completes the order. Settlement and reports close the loop.
